Proofs with Computers: Introduction

Nima Rasekh

Universität Greifswald

11.04.2025

Overview

- **Goal:** To learn how to formulate and program mathematical and logical proofs with computers.
- **Today:**
  - Overview and rules for the lecture
  - Projects
  - History
  - Logic
- **Starting next week:** Formalization in Lean

Logistik

1. Everyone needs access to a laptop!
2. First steps: Installation of VScode, Lean and Git and signing up in GitHub.
3. If there are any problems: Questions!

GitHub Page

Demonstration

Projects

- The grade is determined by a project.
- A project is a formalization and a presentation.
- Everyone who does a project passes.
- Exercises are optional, but **strongly** recommended.
- Everyone who needs a grade: Notify me by **02.05.2025**! Otherwise, you cannot pass.
- Not sure? Still notify me!

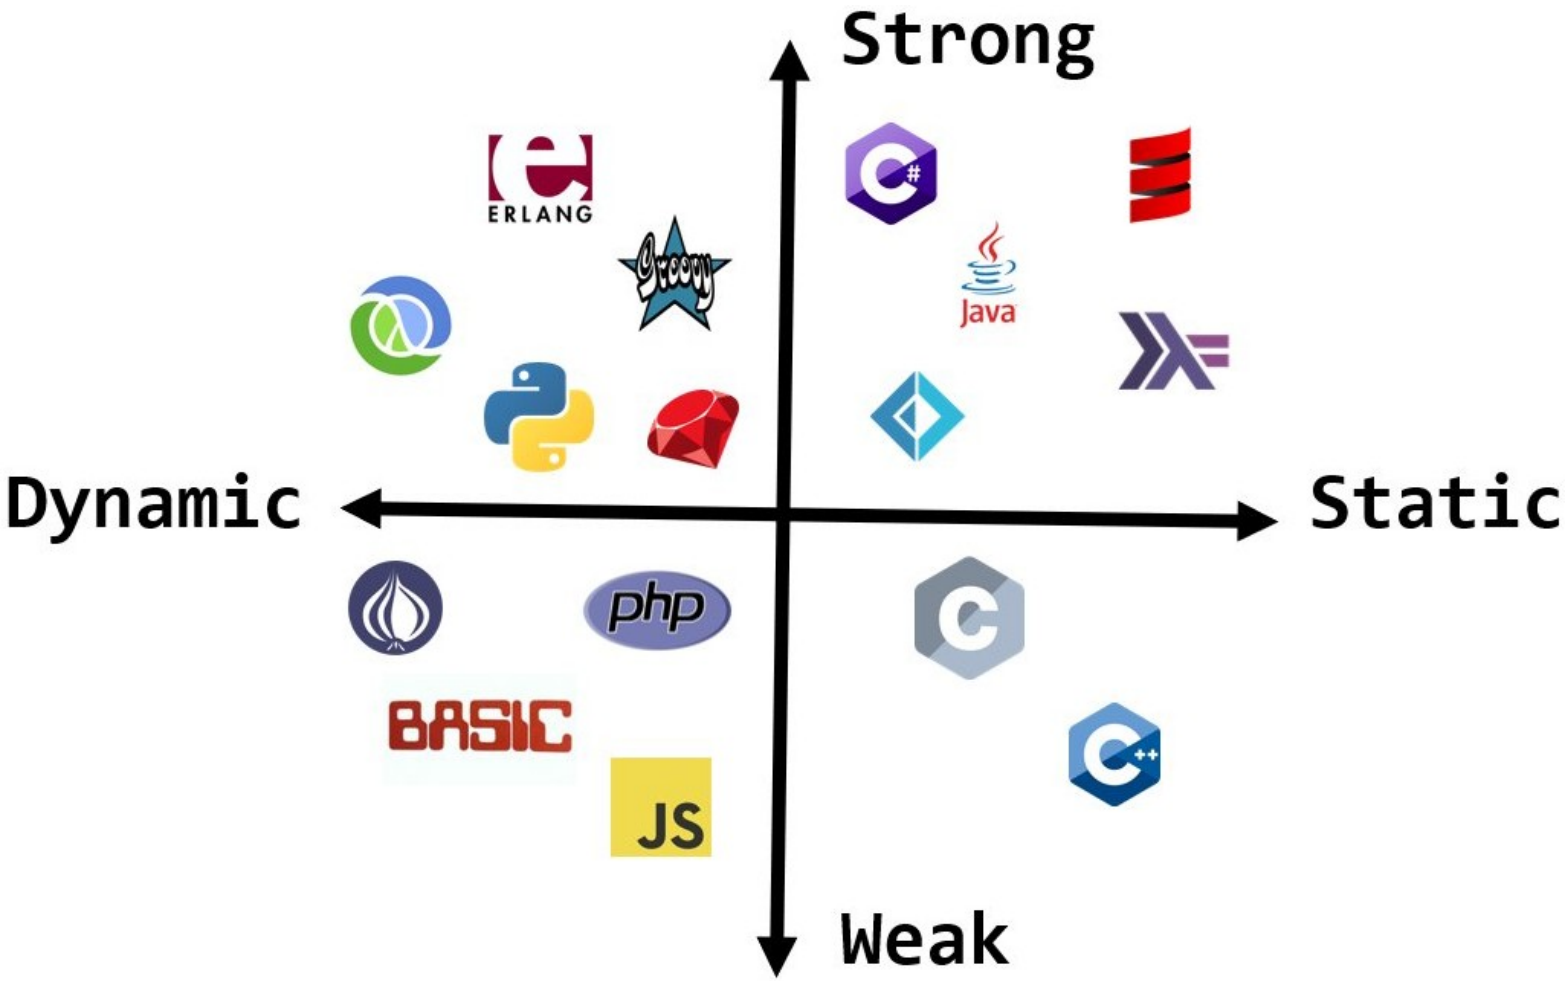
What is the Benefit of Computers?

- Computers check inputs
- Computers automate processes
- Computers manage data

Application of computers in proving programs and mathematics is called:

Formalization!

Programming Languages



Dynamic vs. Static Programming Languages

Demonstration

Where does Formalization come from?

1. First steps in the 60s and 70s with **Automath** and **Logic for Computable Functions**
2. In the 80s and 90s, we have the first languages that are still relevant: **Coq**, **Isabelle**, **Agda**, **PVS**
3. Since the 2000s:
   - New languages: **Metamath**, **Lean**, ...
   - Formalization of interesting problems: **Four color theorem** (2005), **Kepler conjecture**, ...
4. **Why now?** User friendlier, AI, ...

Formalization in Programming

```
From iris.algebra Require Export view.
From iris.algebra Require Import proofmode_classes big_op.
From iris.prelude Require Import options.

(** The authoritative camera with fractional authoritative elements *)
(** The authoritative camera has 2 types of elements: the authoritative
element [●{q} a] and the fragment [◯ b] (of which there can be several). To
enable sharing of the authoritative element [●{q} a], it is equiped with a
fraction [q]. Updates are only possible with the full authoritative element
[● a] (syntax for [●{1} a]]), while fractional authoritative elements have
agreement, i.e., [✓ (●{p1} a1 · ●{p2} a2) → a1 ≡ a2]. *)

(** * Definition of the view relation *)
(** The authoritative camera is obtained by instantiating the view camera. *)
Definition auth_view_rel_raw {A : ucmra} (n : nat) (a b : A) : Prop :=
  b ≼{n} a ∧ ✓{n} a.
Lemma auth_view_rel_raw_mono (A : ucmra) n1 n2 (a1 a2 b1 b2 : A) :
  auth_view_rel_raw n1 a1 b1 →
  a1 ≡{n2}≡ a2 →
  b2 ≼{n2} b1 →
  n2 ≤ n1 →

Formalization in Mathematics

```
Lemma eqm_genus : genus G = genus G'.
Proof.
rewrite {2}/genus /Euler_lhs -eqm_gcomp; have [e n f Eenf Ee En Ef] := eqGG'.
by rewrite /Euler_rhs /= -(eq_fcard Ee) -(eq_fcard En) -(eq_fcard Ef).
Qed.

Lemma eqm_planar : planar G = planar G'.
Proof. by rewrite {2}/planar -eqm_genus. Qed.

End EqualHypermap.

Notation "x '=m' y" := (eqm x y) (at level 70, no associativity).

Lemma eqm_sym G G': G =m G' -> G' =m G.
Proof. by case: G => d e n f EG [] *; apply: EqHypermap => x; auto. Qed.

Lemma dual_inv G : dual (dual G) =m G.
Proof.
case: G (@edgeI G) (@nodeI G) (@faceI G) => d e n f /= eK eI nI fI.
by apply: EqHypermap; apply: finv_inv.
Qed.
```

(a) Four color theorem in **Coq**

```
let float_pow_pos_lo pp x_tm n =
  let rec pow n =
    match n with
      | 0 -> INST[x_tm, x_var_real] float_pow0_lo
      | 1 -> INST[x_tm, x_var_real] float_pow1_lo
      | 2 ->

          let th0 = INST[x_tm, x_var_real; lo_tm, lo_var_real] float_pow2_lo in
            MY_PROVE_HYP mul_lo th0
      | _ ->
          let _ = assert (n > 2) in
          if (n land 1) = 0 then
            (* even *)
            let t_th = pow (n lsr 1) in
              float_pow_pos_double_lo pp x_tm t_th
          else
            (* odd *)
            let t_th = pow (n - 1) in
              float_pow_pos_suc_lo pp x_tm t_th
  in
```

(b) Kepler conjecture in **Isabelle**

```
πₛS³≃ℤ/2ℤ-direct : GroupEquiv (π 4 S³) (ℤGroup/ 2)
πₛS³≃ℤ/2ℤ-direct = DirectProof.BrunerieGroupEquiv

-- This direct proof allows us to define a much simplified version of
-- the Brunerie number:
β' : ℤ
β' = fst DirectProof.computer ηₛ'

-- This number computes definitionally to -2 in a few seconds!
β'≡-2 : β' ≡ -2
β'≡-2 = refl

-- As a sanity check we have proved (commented as typechecking is quite slow):
-- β'Spec : GroupEquiv (π 4 S³) (ℤGroup/ abs β')
-- β'Spec = DirectProof.BrunerieGroupEquiv'

-- Combining all of this gives us the desired equivalence of groups by
-- computation as conjectured in Brunerie's thesis:
πₛS³≃ℤ/2ℤ-computation : GroupEquiv (π 4 S³) (ℤGroup/ 2)
πₛS³≃ℤ/2ℤ-computation = DirectProof.BrunerieGroupEquiv''
```

(c) Homotopy groups in **Cubical Agda**

```

/-- Theorem 9.4 in [Analytic] for weak bounded exactness -/
theorem thm94_weak' :
  ∀ m : ℕ, ∃ (k K : ℝ≥0) (hk : fact (1 ≤ k)) (c₀ : ℝ≥0),

  apply breen_deligne.data.complex.map_norm_noninc
end
```

(d) Liquid Tensor Experiment in **Lean**

100 Problems

Demonstration

Lean

1. We use Lean (Lean 4).
2. Lean is a functional programming language and proof assistant.
3. Lean was developed in 2013 by Leonardo de Moura (first at Microsoft, now at Amazon).
4. Lean 4 was released in 2021 and should not change anymore.
5. Structurally, it resembles Coq.
6. Mathematics in Lean is in MathLib!
7. *Relatively* easy to use and learn.
8. But there **are** many other options!

Lean Online

Demonstration

Logic from a different Perspective

- In classical mathematics, there is **Mathematics** and **Logic**.
- *Let* $f : S \to T$ *be* a **bijective function** of **sets**. *Then* f *is* **injective**.
- **Mathematics** vs. *Logic*!

$\Rightarrow$ We need math and logic in one place!

Proofs as Elements
